Variables in Python

In [1]:
```
first_name = 'HEMENDRA'
```

In [2]:
```
last_name = 'VIKAS'
```

In [3]:
```
country = 'HYD'
```

In [4]:
```
city = 'TELENGANA'
```

In [5]:
```
age = 40087
```

In [15]:
```
is_married = False
```

In [7]:
```
skills = ['HTML', 'CSS', 'JS', 'React', 'Python']
```

In [8]:
```
person_info = {
    'firstname':'Asabeneh',
    'lastname':'Yetayeh',
    'country':'Finland',
    'city':'Helsinki'
    }
```

Printing the values stored in the variables

In [9]:
```
print('First name:', first_name)
```

```
First name: HEMENDRA
```

In [10]:
```
print('First name length:', len(first_name))
```

```
First name length: 8
```

In [11]:
```
print('Last name: ', last_name)
```

```
Last name:  VIKAS
```

In [12]:
```
print('Last name length: ', len(last_name))
```

```
Last name length:  5
```

In [13]:
```
print('Country: ', country)
```

```
Country:  HYD
```

In [14]:
```
print('City: ', city)
```

```
City:  TELENGANA
```

In [16]:
```
print('Married: ', is_married)
```

```
Married:  False
```

In [17]:
```
print('Skills: ', skills)
```

```
Skills:  ['HTML', 'CSS', 'JS', 'React', 'Python']
```

In [18]:
```
print('Person information: ', person_info)
```

```
Person information:  {'firstname': 'Asabeneh', 'lastname': 'Yetayeh', 'country':
'Finland', 'city': 'Helsinki'}
```

Declaring multiple variables in one line

In [19]:
```
first_name, last_name, country, age, is_married = 'Hemendra', 'Vikas', 'Helsink'
```

In [20]:
```
print(first_name, last_name, country, age, is_married)
```

```
Hemendra Vikas Helsink 250 False
```

In [21]:
```
print('First name:', first_name)
```

```
First name: Hemendra
```

In [22]:
```
print('Last name: ', last_name)
```

```
Last name:  Vikas
```

In [23]:
```
print('Country: ', country)
```

```
Country:  Helsink
```

In [24]:
```
print('Age: ', age)
```

```
Age:  250
```

In [25]:
```
print('Married: ', is_married)
```

```
Married:  False
```
